Day – 02 – Linux Fundamentals

File system navigation

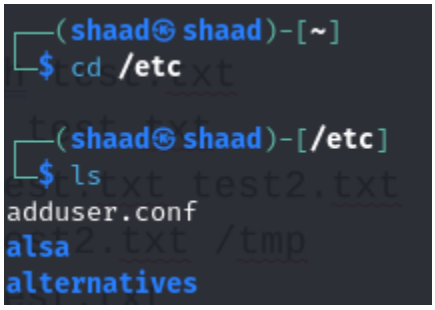

pwd: Shows present working directory.

Ls -la: lists all files and directories including hidden ones in detail.

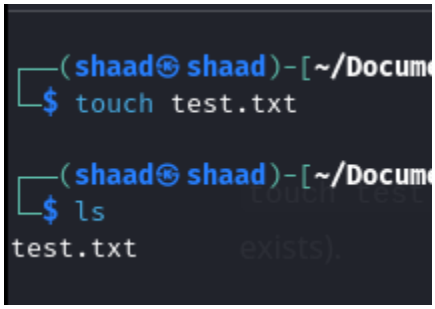

Cd /etc : changes directory to /etc. /etc contains configuration files

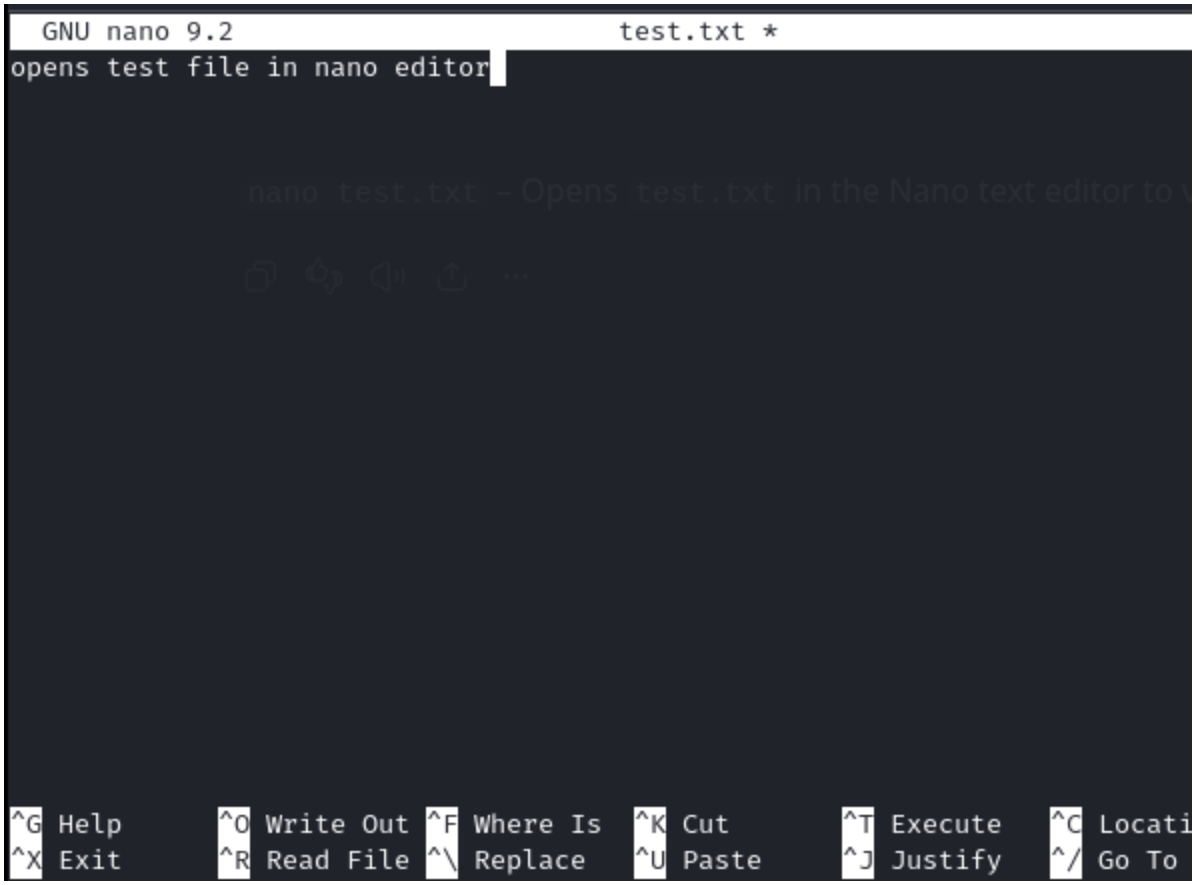

File Operations

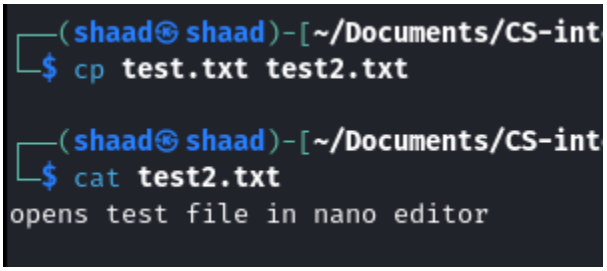

touch test.txt : creates an empty file named test.txt

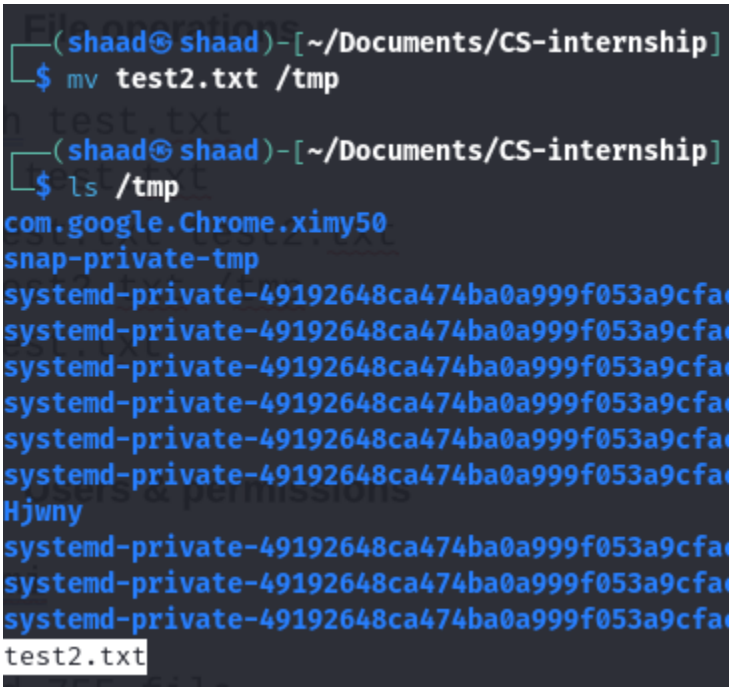

nano test.txt : opens test.txt in nano text editor

cp test.txt test2.txt : copies test.txt to new file test2.txt

mv test2.txt /tmp : moves test2.txt to /tmp directory

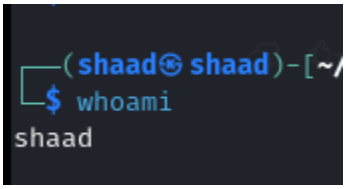

rm test.txt : deletes test.txt

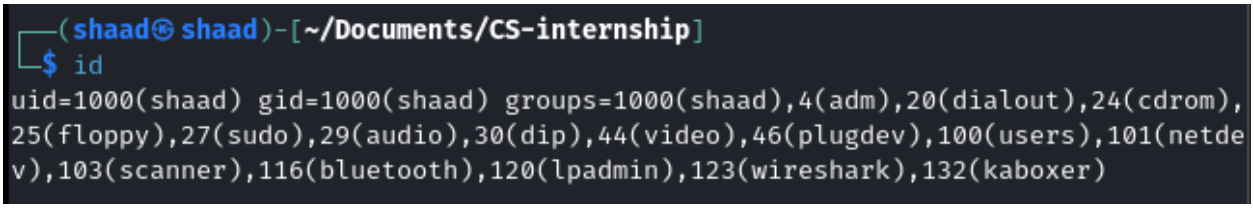

Users & permissions

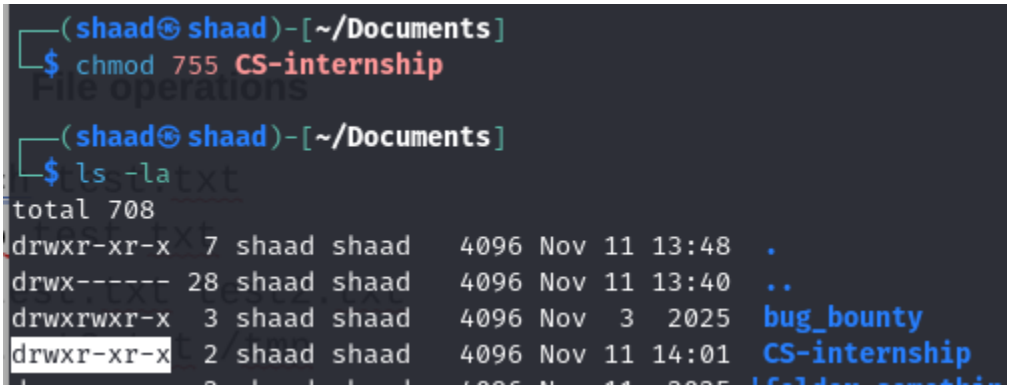

Whoami : shows the username of the current user

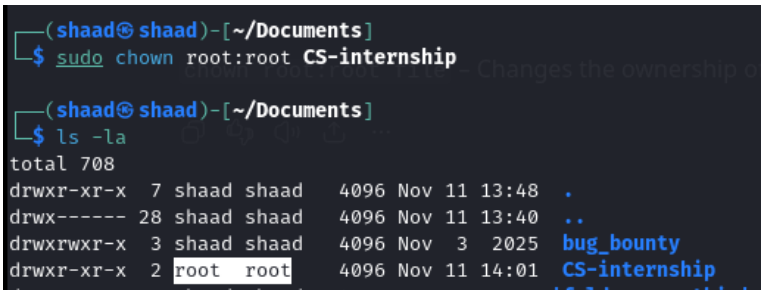

id : shows current users UID, GID and group membership

chmod 755 file : Changes file permissions to allow the owner to read, write, and execute, while others can read and execute

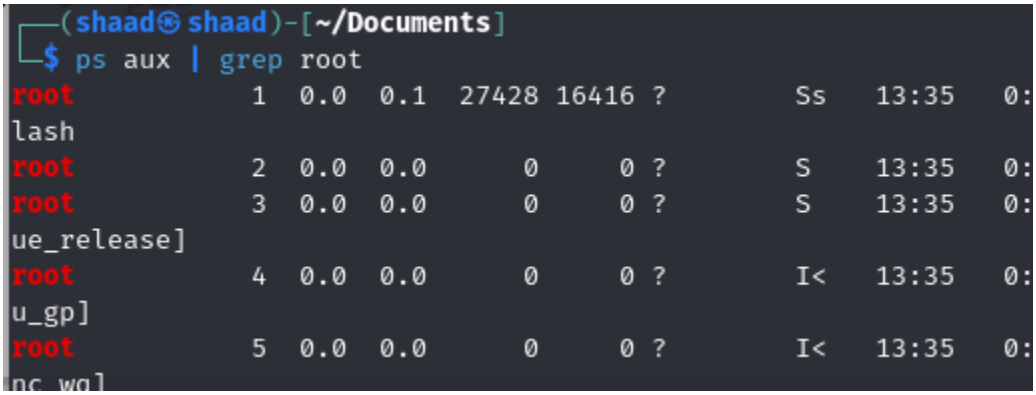

chown root:root file : changes ownership to user root and group root

Processes

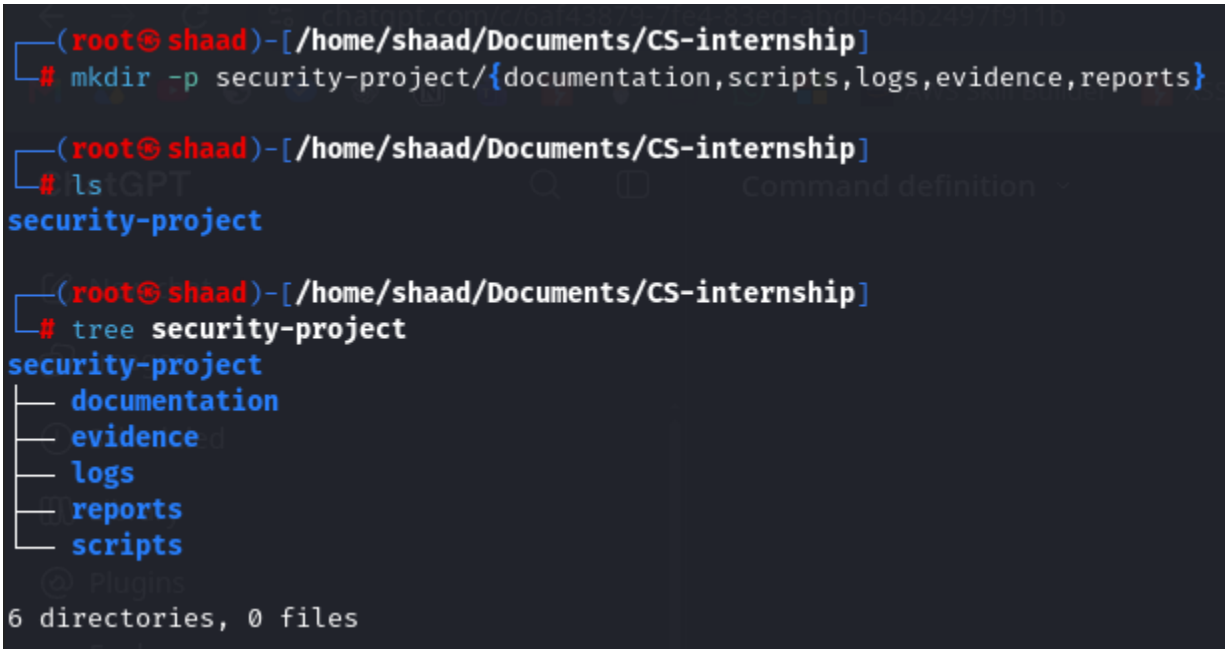

ps aux | grep root : Lists running processes and filters the results to show entries containing root

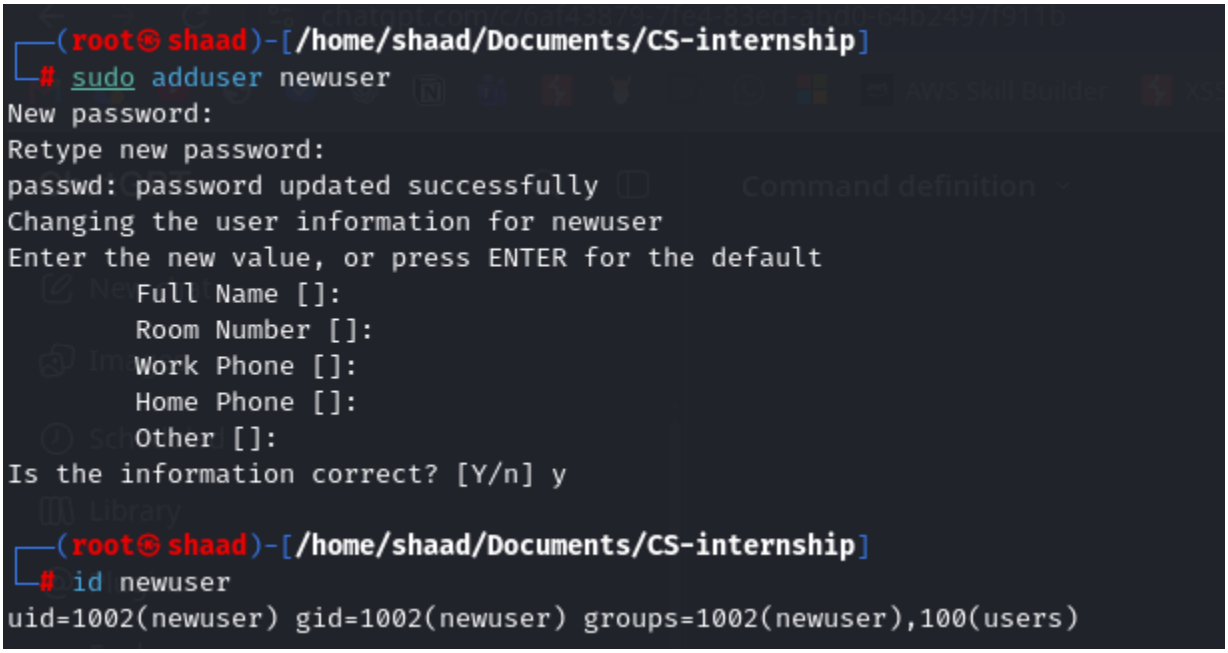

Kill -9 <PID>: forcefully terminates a process using its PID

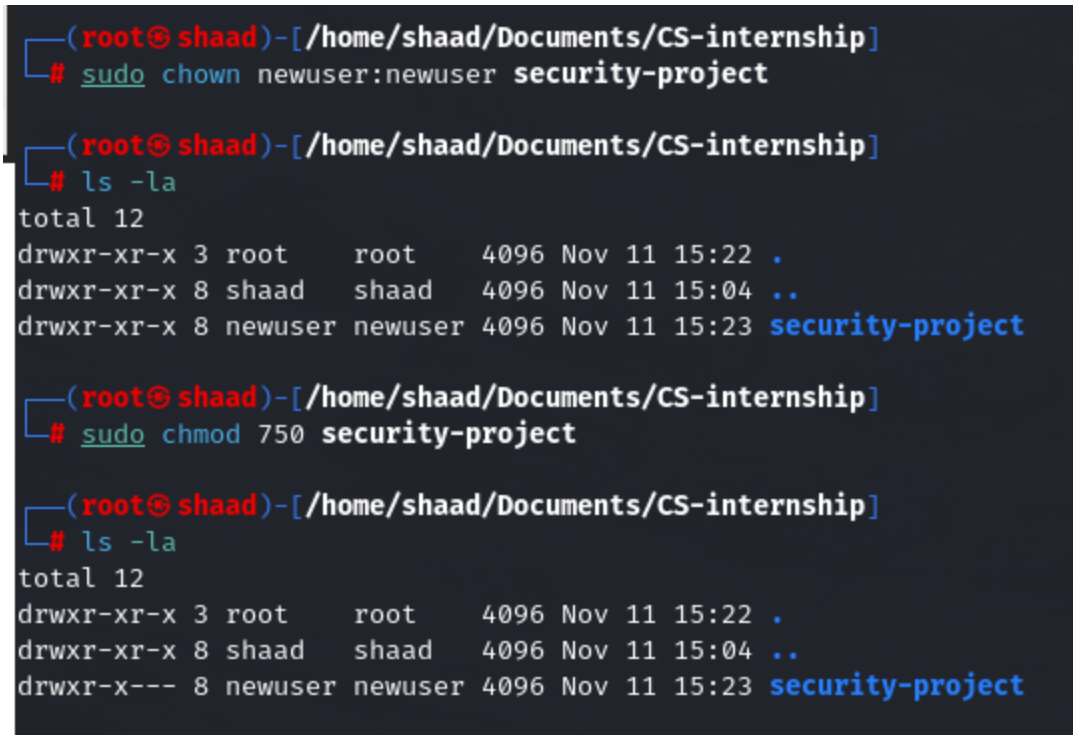

Hands on Task - Day-02

Create a directory structure for a “security project”

Create a non root user and assign permission

Created a non-root user named newuser, changed the ownership of an existing folder from root to newuser using chown, and assigned permissions using chmod 750.
